INTRODUCTION

The semantic department website is a responsive web-based project developed using HTML and CSS to provide structured and organized information about academic department. The website is designed using HTML5 semantic elements such as `<header>`, `<nav>`, `<main>`, `<section>`, `<article>`, `<aside>` and `<footer>` to demonstrate the proper structure and organization of a modern web page. The website includes various sections and pages such as Home, About department, faculty, courses, timetable, achievements, events, and contact. It provides information about the department's vision, mission, objective, faculty members, courses, semester-wise subjects, class and contact details. HTML5 is used to structure the content semantically, while CSS is used to create the visual design, including colours, typography, spacing, navigation menu, card, tables, buttons, and responsive layouts. The project demonstrates the practical implementation of semantic HTML5 and front-end web development concepts while creating a user- friendly and responsive department website.

CONCLUSION

The semantic department website successfully demonstrates the practical implementation of HTML5 semantic elements to create a well-structured and organized departmental website. The website effectively presents important information such as department details, vision, mission, objective, faculty members, courses, timetables, achievements, events, and contact information in a clear and user-friendly manner. The use of semantic HTML elements improves the structure, readability, and accessibility of the web pages, while CSS provides an attractive and responsive, organizing web content, designing responsive layouts, and professional website for an academic department.
